TB300 Fiber Fineness & Content Analyser

Fiber composition (Qualitative) and content (Quantitative) analysis is a necessary test item for every laboratory and most cotton mills, cloth factories and garment factories. Currently, the detection methods commonly used are dissolution and combustion.

It will be a easy task to distinguish with the microscope natural fibers for they are structurally stable, differ in their longitudinal and cross-sectional morphological features. It is the same for chemical fibers; TB300 aims to make a quantitative analysis of the fibers by intercepting the points from the longitudinal or cross-sectional projection. The operation is simple, but the projection interface is clear, and the probability of error is low; moreover, this method has no pollution and does not cause any harm to the human body; TB300 will promise high working efficiency and save time and cost.

Fiber Fineness & Content Analyser, is used to determine the fineness of fiber and analyze the content and surface features of animal fiber, vegetable fibers and mineral fibers, such as cotton, wool, man-made fiber, etc.

Note: A customized PC is needed for this instrument.
